# EcoCleaning

Technical Implementation Documentation

## Design and implementation

EcoCleaning uses eight separate HTML pages with shared main.css and script.js, plus scoped home.css and about.css. The existing green, mint and cream palette, Georgia headings, Arial body text, rounded cards and hero image provide contrast, repetition, alignment and proximity. Prominent booking links expose the primary task above the fold. Case-study staff, testimonials, promotions and membership details replace unsupported business claims.

## Responsive CSS and navigation

Containers occupy 95% of the viewport up to 1300px. Grid and Flexbox organise cards and forms, with layout changes at 950px and 700px; the root font size becomes 85% below 950px. Tables scroll within labelled regions instead of widening the page. The scalable header wordmark links home beside the desktop navigation. A consistent two-tier navigation supports pointer, keyboard and touch input. Locally bundled SlickNav replaces desktop navigation below 700px; expanded states and Escape handling support accessibility. Header borders, the original dark footer with muted text, and scoped resource-link colours implement case-study styling.

## Semantic HTML, SEO and accessibility

Every page includes header, nav, main, aside and footer elements, one h1, an English language declaration and viewport metadata. Distinct descriptive titles, descriptions and relevant meta keywords identify each page. A skip link focuses main content; aria-current identifies the current page. The homepage image has descriptive alternative text and explicit dimensions. Table captions and scoped headers explain comparisons. Form labels, autocomplete attributes, visible focus indicators, polite live messages and aria-invalid support input and feedback. Reduced-motion rules suppress nonessential animation.

## JavaScript and data evaluation

jQuery validates booking, contact and registration forms through checkValidity(), reportValidity() and explicit rules. Text is trimmed; required fields, lengths, email format, telephone characters and digit counts are checked. Registration includes names, address, telephone, email, event interest and optional comments; passwords require eight characters, a letter, a digit and matching confirmation. Booking rejects past dates and restricts recurring previews to 2-12 appointments. Weekly, fortnightly and monthly calculations handle short months and leap years. Known service, membership and event links preselect valid options. Feedback explains outcomes and valid submissions reset personal fields.

## Functionality and scope

packages.html compares the three supplied monthly memberships and their exact benefits. Valid bookings create in-memory appointment rows; users assign a named responsible staff member and update status or clear the schedule. These demonstrations do not confirm real visits, check availability, process payments, send enquiries or retain accounts. Records disappear when the booking page closes or reloads. Local jQuery, SlickNav and Lucide assets allow direct offline use without Live Server or npm.
