EcoCleaning

Technical Implementation Documentation

Implementation scope

EcoCleaning comprises eight separate HTML pages sharing css/main.css and js/script.js. Additional stylesheets, home.css and about.css, scope page-specific presentation. The implementation is a frontend coursework demonstration; successful form validation does not create appointments, transmit enquiries, store accounts, or process payments.

UI/UX and navigation

The interface combines green, mint and cream colours with Georgia headings and Arial body text. Rounded cards, consistent spacing and prominent booking buttons establish visual hierarchy. The sticky header repeats primary navigation across pages, while active link styling identifies the current primary page. Registration is accessible through utility and footer links. packages.html presents a comparison table; service and event links lead to booking or contact pages without transferring selections.

Responsive design and CSS

Shared containers use 95% width with a 1300px maximum. CSS Grid and Flexbox organise forms, service cards and navigation. Main stylesheet breakpoints at 950px and 700px simplify layouts; forms become single-column on small screens. home.css additionally adjusts service cards at 1050px and the hero between 951px and 1100px. The package table remains horizontally scrollable through .table-wrap. CSS custom properties centralise colours, borders and shadows; clamp() scales headings.

Semantic HTML, SEO and accessibility

Pages use header, nav, main, section and footer landmarks, with article elements for service and event content. Each page declares English, UTF-8, a viewport, a distinct title and an h1. All pages share the same meta description, limiting page-specific SEO. The homepage WebP image includes descriptive alternative text and explicit dimensions. Form controls are nested within labels; feedback containers use aria-live="polite". The menu button exposes aria-expanded, input focus receives a visible outline, and home service transitions respect reduced-motion preferences. These measures do not establish full accessibility conformance.

JavaScript, jQuery and validation

CDN-loaded jQuery 3.7.1 toggles the mobile menu and updates its expanded state; selecting a navigation link closes it. Form handlers prevent submission and explicitly call checkValidity() and reportValidity() despite novalidate attributes. Booking requires contact, service, package, schedule and address fields; names require two characters, email uses native format validation, and phone accepts 7-20 permitted characters. JavaScript sets the earliest booking date to the local current date. Contact subjects require three characters and messages ten. Registration requires two-character names, email, accepted terms and passwords of at least eight characters containing a letter and digit; confirmation must match. Valid submissions display feedback and reset the form. Homepage Lucide icons are generated from a separate CDN script.
